# Agenda

1. Context
2. Dataset
3. Noise detection
4. Conclusion

## **Context**

---

## Context

$$L_o(x, \omega_o) = L_e(x, \omega_o) + \int_{\Omega} L_i(x, \omega_i) \cdot f_r(x, \omega_i \rightarrow \omega_o) \cdot \cos \theta_i d\omega_i \quad (1)$$

### Photorealistic image synthesis

- Global illumination rendering
- Monte Carlo

# Context: noise in photorealistic image

(a) After 1 sample

(b) After 20 samples

(c) After 10, 000 samples

## Context: noise in photorealistic image

(a) After 1 sample

(b) After 20 samples

(c) After 10, 000 samples

**Question:**

**How can human perceive this MC noise ?**

## Dataset

---

## Dataset creation: need of human data

### Problem of photorealistic image synthesis rendering

- No-reference context during rendering
- Unavailable models for noise perception in MC generated images
- No human perceptual reference data

## Dataset creation: need of human data

### Problem of photorealistic image synthesis rendering

- No-reference context during rendering
- Unavailable models for noise perception in MC generated images
- No human perceptual reference data

### A solution

Collect human subjective perceptual threshold during rendering as ground truth

## Dataset creation: need of human data

### Problem of photorealistic image synthesis rendering

- No-reference context during rendering
- Unavailable models for noise perception in MC generated images
- No human perceptual reference data

### A solution

Collect human subjective perceptual threshold during rendering as ground truth

### Build a model

Use these perceptual thresholds into a perceptual noise model

# Perception: definition

## Just-Noticeable Difference (JND)

Noise can be viewed as a perceptible difference into image

20 samples

1000 samples

### Structural Similarity Index (SSIM)

SSIM metric quantifies the visibility of errors between a distorted image and a reference image using a variety of known properties of the human visual system.

Context  
○○○

Dataset  
○○○○●○○○

Noise detection  
○○○○○○○○○○○○○○○○○○

Conclusion  
○○○○○○○

## Build of new dataset

### Previous dataset

- 9 viewpoints from scenes
- different renderers (maxwell, igloo, cycle...)
- hence, different algorithms

## Build of new dataset

### Previous dataset

- 9 viewpoints from scenes
- different renderers (maxwell, igloo, cycle...)
- hence, different algorithms

### New dataset

- 40 viewpoints with 10,000 images of 1 sample (HD images)
- only **pbrt-v3** renderer
- use of **path-tracing**
- available soon

Context  
○○○

Dataset

## SVD attributes

## Singular Value Decomposition

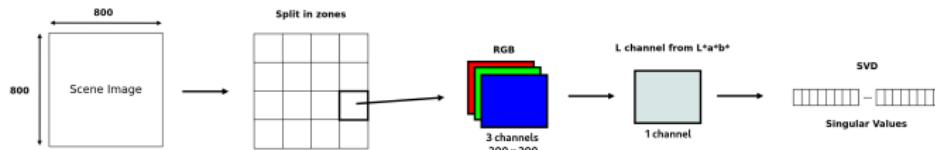

$$\mathbf{M}_{m \times n} = \mathbf{U}_{m \times m} \Sigma_{m \times n} \mathbf{V}^*_{n \times n}$$

The diagram illustrates the Singular Value Decomposition (SVD) of a matrix  $M$ . The matrix  $M$  is shown as a grid. It is decomposed into three components:  $U$ ,  $\Sigma$ , and  $V^*$ .  $U$  is a vertical stack of colored rectangles (green, blue, orange, purple).  $\Sigma$  is a rectangular diagonal matrix with non-negative values on the diagonal.  $V^*$  is a horizontal stack of colored rectangles (purple, pink, blue, green).

where:

- $M$  is an  $m \times n$  real or complex matrix
- $U$  is an  $m \times m$  real or complex unitary matrix.
- $\Sigma$  is an  $m \times n$  rectangular diagonal matrix with non-negative real numbers on the diagonal.
- $V$  is an  $n \times n$  real or complex unitary matrix.

# SVD attributes

## Singular Value decomposition

$$\mathbf{M}_{m \times n} = \mathbf{U}_{m \times m} \mathbf{\Sigma}_{m \times n} \mathbf{V}^*_{n \times n}$$

where:

The diagram shows the matrices involved in SVD:

- $\mathbf{M}_{m \times n}$ : A general matrix of size  $m \times n$ .
- $\mathbf{U}_{m \times m}$ : A unitary matrix of size  $m \times m$ , shown as a vertical stack of two colored columns (teal and light blue).
- $\mathbf{\Sigma}_{m \times n}$ : A rectangular diagonal matrix of size  $m \times n$ , shown as a 4x3 grid with orange and yellow entries.
- $\mathbf{V}^*_{n \times n}$ : A unitary matrix of size  $n \times n$ , shown as a horizontal stack of three colored rows (orange, purple, pink).

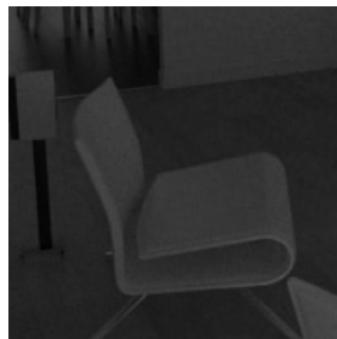

- $M$  is an  $m \times n$  real or complex matrix
- $U$  is an  $m \times m$  real or complex unitary matrix.
- $\Sigma$  is an  $m \times n$  rectangular diagonal matrix with non-negative real numbers on the diagonal.
- $V$  is an  $n \times n$  real or complex unitary matrix.

## SVD attributes

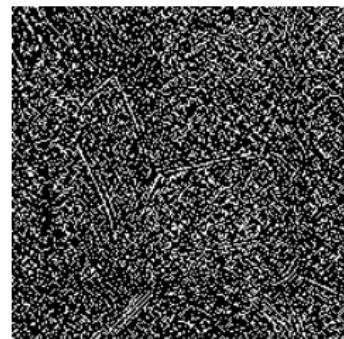

Possibility to decompose image using SVD into structure dependent and non-dependent images (Wang et al. 2013).

(a) L chanel (500 samples)

(b) SVD reconstruction (0, 50)

(c) SVD reconstruction (50, 200)

## SVD-Entropy and RNN

$$\mathbf{M}_{m \times n} = \mathbf{U}_{m \times m} \Sigma_{m \times n} \mathbf{V}^*_{n \times n}$$

*Shannon entropy* of singular values can be defined as SVD-Entropy (O.Alter, P.O.Brown, and D.Bolstein 2000):

$$H_{SVD} = -\frac{1}{\log(O)} \sum_{i=1}^O \bar{\sigma}_i \log(\bar{\sigma}_i) \quad (2)$$

where :

$$\bar{\sigma}_i = \sigma_i^2 / \sum_{p=1}^O \sigma_p^2 \quad (3)$$

## SVD-Entropy

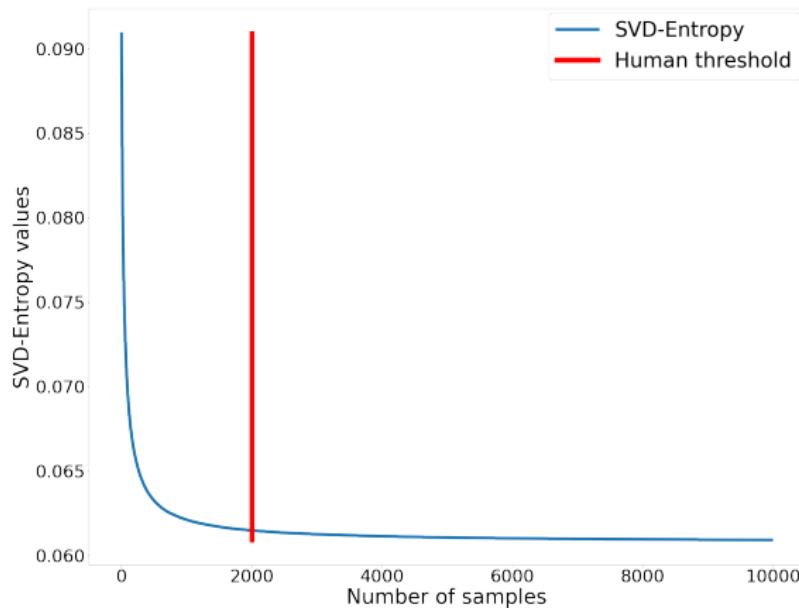

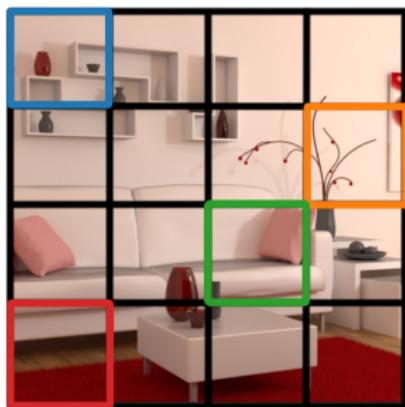

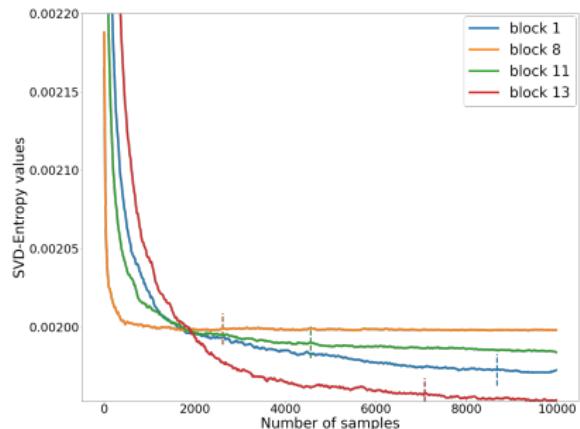

Figure 7:  $H_{SVD}$  evolution during over Kitchen image.

# SVD-Entropy and RNN

**Figure 9:** Recurrent neural network with different samples images level as input

## SVD-Entropy and RNN

**Figure 10:** Recurrent neural network with different samples images level as input

# SVD-Entropy and RNN

## Parameters studied:

- The size of the sequence of RNN with  $k \in [3, 4, \dots, 10]$  ;
- $m \in [4, 25, 100, 400]$  (number of sub-blocks cut out within the block).  
Sub-blocks are respectively of size  $100 \times 100$ ,  $40 \times 40$ ,  $20 \times 20$  and  $10 \times 10$  ;
- Batch size:  $b_s \in [64, 128]$  ;
- Samples sequence step:  $n \in [20, 40, 80]$  ;
- Input normalization: *bnorm* or *snorm* ;
- The value extracted from a sub-block  $F \in [H_{SVD}, H_{SVD}^1, H_{SVD}^2]$ .

where:

$$H_{SVD}^1 = -\frac{1}{\log(\frac{O}{4})} \sum_{i=0}^{O/4} \bar{\sigma}_i \log_2 \bar{\sigma}_i \quad H_{SVD}^2 = -\frac{1}{\log(O - \frac{O}{4})} \sum_{i=O/4}^O \bar{\sigma}_i \log_2 \bar{\sigma}_i$$

# SVD-Entropy and RNN

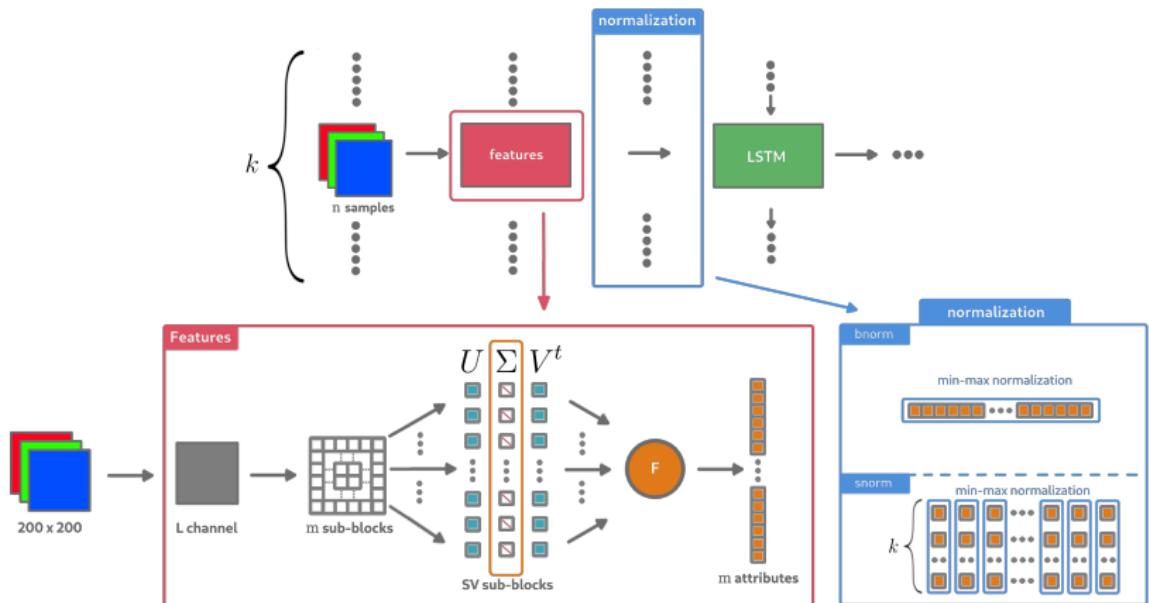

Figure 11: Pipeline for SVD-Entropy and RNN

# SVD-Entropy and RNN

## Fixed parameters:

- **RNN:** LSTM (512) / LSTM (128) / LSTM (32) / Sigmoid (1) ;
- Dropout for each LSTM layers set to 40% ;
- Recurrent activation function: *Hard Sigmoid* (input, forget, and output gates);
- Activation function: *Sigmoid* (hidden state and output hidden state);
- Balanced samples weights when propagating binary crossentropy loss.

## Dataset specifications

Around 300.000 samples (depending of  $k$ ) obtained from the 40 viewpoints. 12 blocks used as train data set, the 4 others as testing data set part. Same dataset (train / test) is used for each run (parameters combination).

# SVD-Entropy and RNN

## Comparisons metrics:

- Accuracy: fraction of predictions model got right;
- AUC ROC: Area Under Curve of receiver operating characteristic curve.

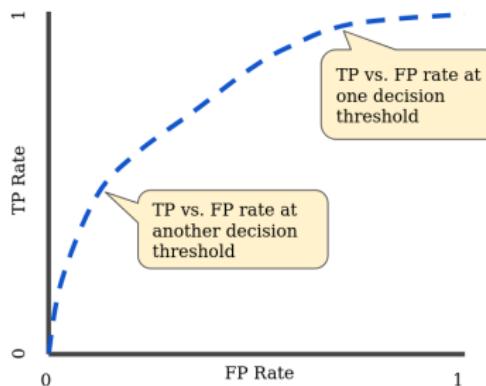

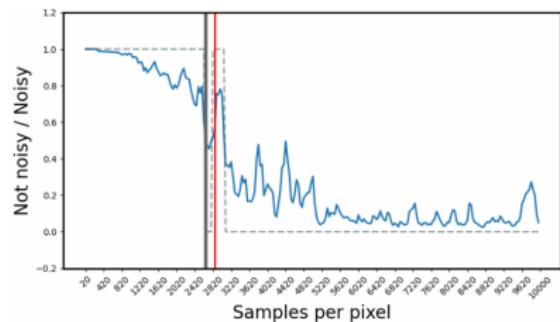

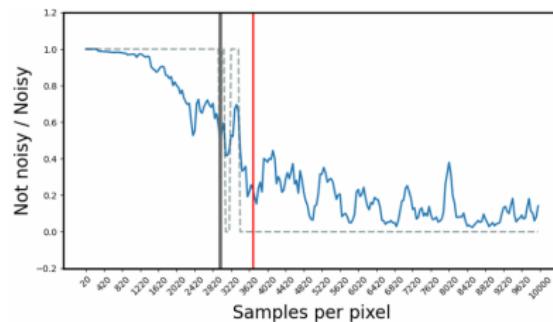

Figure 12: AUC ROC for regression logistic model

# SVD-Entropy and RNN

$k$	$m$	$F$	$b_S$	$bnorm$	$snorm$	$n$ step	Acc Train	Acc Test	AUC Train	AUC Test

10	100	$H_{SVD}$	128	0	1	40	84.52 %	82.58 %	84.20 %	82.16 %

**Table 1:** 10 best parameters combinations results for RNN model

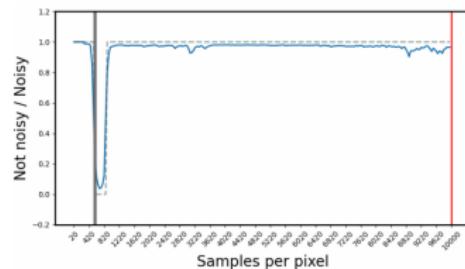

# SVD-Entropy and RNN

## Prediction fluctuation

To overcome this problem and to make thresholds prediction more robust, it was proposed to consider that a block is no longer noisy after **3 successive noiseless predictions**.

# SVD-Entropy and RNN

(a) Predictions over the block 10 of *Bathroom* viewpoint

(b) Still noisy block 10 with 500 samples

(c) Reference block 10 with 10,000 samples

## Critical prediction

The block targeted here from the bathroom point of view is still noisy up to 10,000 samples and seems to contain a significant light reflection.
